Product Overview

Problems & Solutions

Problems Solutions

Delivered admin consistency across channels, reduces context switching for agents, automates CRM task creation, and gives tenant admins compact but powerful configuration tools for business hours, routing, and workforce management.

Problems

Fragmented channel data
Customer context is often scattered across chat, calls, and CRM.

Overworked agents
Manual ticketing and context switching increases handle time.

Inflexible admin controls
Tenant admins require non-developer configuration for hours, routing, and tracking.

Security & compliance
Enterprise clients demand strict controls and auditable workflows.

Solutions

Omnichannel routing
Voice, chat, SMS, WhatsApp, email, web chat.

Copilot AI
Intent detection, sentiment analysis, auto summaries, and real-time suggestions.

Tenant Admin Console
Business hours, holiday calendar, after-hours workflows, agent capacity, and RONA rules.

CRM Sync
auto-create action tasks with interaction metadata and route them to the correct support queues.

Design Approach

Design Approach

A user-centred, outcome-driven process focused on clarity, speed, and scalability, delivering a platform that balances admin control with agent efficiency.

01
Research-Driven
We analyzed agent workflows and admin needs to design a system that improves efficiency and reduces friction across all interaction types.

02
Component-Based
A scalable component library was created to maintain consistency across the platform and support future feature expansion.

03
Simplified Complexity
Advanced configurations (routing, capacity rules, automation) are progressively surfaced into clean, intuitive UI patterns.

04
Iterative Refinement
Design decisions were validated through continuous testing and feedback loops to ensure usability and real-world applicability.

Project Timeline

Project Timeline

A timeline refers to a structured plan that outlines the key phases and activities involved in the design and development of the Cisco AI platform over a specified duration.

Empathy Map

Empathy Map

This map details the experience of Samira, a Contact Center Agent. Her performance suffers due to Fragmented Data, Context-Switching, and Manual Workload. The goal is quick, efficient, customer resolution.

SAY
- I have to check 4 different systems just to get the complete picture on one call.
- I feel like I'm doing repetitive data entry instead of providing solutions to a customer.
- It's hard to gauge the customer's mood when they are upset, especially across different channels.

THINK
- I have to check 4 different systems just to get the complete picture on one call.
- I feel like I'm doing repetitive data entry instead of providing solutions to a customer.
- It's hard to gauge the customer's mood when they are upset, especially across different channels.

DOES
- Asks the customer to repeat their history when the information isn't available in the CRM fast enough.
- After the call ends, manually creates and fills out the CRM Task (ticket) with interaction details.
- Prioritizes following the script over truly understanding the customer's (sentiment (emotions).

FEELS
- Asks the customer to repeat their history when the information isn't available in the CRM fast enough.
- After the call ends, manually creates and fills out the CRM Task (ticket) with interaction details.
- Prioritizes following the script over truly understanding the customer's (sentiment (emotions).

Typography & Color

Typography & Color

The Typography and Color Palette are designed to promote clarity, accessibility, and trust. This visual strategy is critical for managing the high volume of data on the Agent and Admin Consoles, ensuring efficient service.

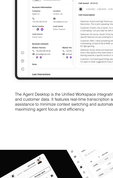
Grid Style

Grid Style

The Optx9 Grid System is the interface foundation, ensuring scalability, consistency, and efficiency. A structured grid is critical for managing the high density of information required across the Agent Desktop and Admin Console.



Wireframe

Wireframe

The wireframes served as the low-fidelity blueprint to validate core workflows and information hierarchy. They established functional priorities for the Unified Agent Desktop and Admin Console, ensuring that key actions and data visualizations were clearly structured before final visual design.

User Flow

User Flow

The Optx9 User Flow ensures smooth, intuitive navigation for both Tenant Admins and Agents. It helps them efficiently perform key tasks and manage complex workflows, supporting productive and swift operations.

Dashboard

Dashboard

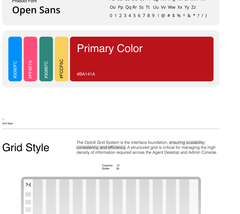
The Optx9 Dashboard is designed to provide contact center supervisors and administrators with easy access to critical functions and real-time performance metrics at a glance. Its goal is to enable rapid decision-making regarding staffing, capacity, and service quality.

Real-time Performance Monitoring

The dashboard prioritizes at-a-glance visibility of key performance indicators (KPIs) relevant to service level and agent activity.

- **Service Level Agreement (SLA) Tracker:** Displays the current percentage of calls accepted versus missed, ensuring the team is meeting service standards.
- **Time Metrics:** Features prominent gauges for Average Waiting Time and Average Call Duration, allowing supervisors to quickly identify bottlenecks or spikes in interaction length.
- **Interaction Statistics:** Provides a snapshot of volume and efficiency, including:
  - Total Interactions and Historical Interactions.
  - Untreated Interactions and Forwarded volume.
  - After Call Work (ACW) and Daily Utilization.

Active Interactions



The Agent Desktop is the Unified Workspace integrating all channels and customer data. It features real-time transcription and Copilot AI assistance to reduce handle time and automate tasks, maximizing agent focus and efficiency.
